# Band I, V, and VIII WCDMA Femtocell Transceiver with GSM Monitoring 

## General Description

The MAX2550 is a complete single-chip RF-to-bits and bits-to-RF radio transceiver. This device is in compliance with the 3GPP TS25.104 femtocell standard for Band I, V, and VIII. It is equipped with multiple receive inputs and transmit outputs for low band, high band, and macro-cell monitoring (Table 1).

This fully integrated transceiver facilitates compact radio designs for dongle and standalone femtocell products by minimizing external component count. Maxim's MAX-PHY serial interface is used to drastically reduce IC pin count, while worldwide field-proven architecture accelerates time to product deployment.
The device features unparalleled receive blocker performance and the industry's lowest noise figure for higher data rates and range. Low-power operational modes are available to minimize power consumption. The transmitter is designed to deliver EVM far exceeding the standard requirement at 0 dBm .
The MAX2550-MAX2553 is a family of pin-compatible transceivers that cover all major WCDMA and cdma2000® bands. All parts are controlled by a 4-wire interface.
The MAX2550 is packaged in a compact $7 \mathrm{~mm} \times 7 \mathrm{~mm}$ TQFN and specified over the $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ extended temperature range. A complete radio reference design is available to facilitate custom designs.

## Applications

WCDMA Band I, V, and VIII Femtocells

Ordering Information and Simplified Block Diagram appear at end of data sheet.

For related parts and recommended products to use with this part, refer to www.maxim-ic.com/MAX2550.related.

## Benefits and Features

- Single-Chip Femtocell Radio Transceiver
- WCDMA/HSPA+ Band I, V, and VIII Operation
- TS25.104 Standard Compliant
- Multiple LNA Inputs for WCDMA, PCS, and GSM Macrocell Monitoring
- High Level of Integration
$\diamond$ On-Chip Fractional-N Frequency Synthesizers for LO Generation
$\diamond$ No Tx SAW Filters Required
$\diamond$ Integrated PA Drivers for Lower-Cost Power Amplifier Designs
$\diamond 12$-Bit AFC DAC to Control TCXO
$\diamond$ On-Chip Temperature Sensor
$\diamond$ Three General-Purpose Outputs
$\diamond$ Reference Clock with Selectable CMOS and Low Swing Output
$\diamond$ PLL Lock-Detect Output Through GPO3
- Optimized Receiver Performance
$\diamond$ Exceptional Receive Sensitivity
$\diamond$ High Dynamic Range Sigma-Delta ADCs Allow Simple AGC Implementation with Switched Gain States
- Optimized Transmitter Performance
$\diamond$ Factory Calibrated for Gain, Carrier Leakage, and Sideband Suppression
$\diamond$ 10-Bit Gain Control Resolution for Better Power Accuracy
$\diamond$ 60dB Gain Control Range
- Loopback Operating Mode from Tx Baseband Input to Rx Baseband Output
- MAX-PHY Serial Digital Interface
- SPI Read/Write Functionality
- Operation Controlled by 4-Wire Serial Interface
- Low-Cost, 7mm x 7mm TQFN Package

# Band I, V, and VIII WCDMA Femtocell Transceiver with GSM Monitoring 

## ABSOLUTE MAXIMUM RATINGS

Junction Temperature ..................................................... $+150^{\circ} \mathrm{C}$
Operating Temperature Range .......................... $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$
Storage Temperature Range............................ $65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$
Lead Temperature (soldering, 10s) ................................ $+300^{\circ} \mathrm{C}$
Soldering Temperature (reflow) ...................................... $+260^{\circ} \mathrm{C}$

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## PACKAGE THERMAL CHARACTERISTICS (Note 1)

TQFN
Junction-to-Ambient Thermal Resistance ( $\theta_{\mathrm{JA}}$ ) $\ldots \ldots . . .25^{\circ} \mathrm{C} / \mathrm{W} \quad$ Junction-to-Case Thermal Resistance $\left(\theta_{\mathrm{JC}}\right) \ldots . . . . . . . . . . . . . . . .1^{\circ} \mathrm{C} / \mathrm{W}$
Note 1: Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a fourlayer board. For detailed information on package thermal considerations, refer to www.maxim-ic.com/thermal-tutorial.

## DC ELECTRICAL CHARACTERISTICS

$\left(\mathrm{V}_{C C}=3.0 \mathrm{~V}\right.$ to $3.6 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=-40$ to $+85^{\circ} \mathrm{C}, 50 \Omega$ system, $\mathrm{f}_{\text {REFIN }}=19.2 \mathrm{MHz}$, typical values are at $\mathrm{V}_{\mathrm{CC}}=3.3 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}$, unless otherwise noted. Register settings as defined in tables following the specification tables.) (Note 2)

## General Comments

#### Abstract

MAX-PHY MAX-PHY is Maxim's solution for the digital interface system between the radio IC and the baseband/DSP. It is a multimode, software programmable, digital signal postprocessing engine that processes the data out of the radio IC and produces the digital filtered outputs for use in the DSP. It enables multimode operation of the radio through software control. Maxim offers an evaluation kit for the MAX2550 along with an FPGA-based MAX-PHY evaluation platform. The FPGA includes the recommended digital channel-selection filters. The Verilog code for these filters is also available for integration into the DSP. Contact Maxim for further information.

## Additional Information

The specifications in the following pages calculate sensitivity with a specified front-end loss from a measured sig-nal-to-noise and distortion ratio (SNDR) and an assumed minimum output SNDR SENS needed for demodulation at sensitivity. The sensitivity values can be related to noise figure by the formula:

Noise Figure of MAX2550 (dB) = Sensitivity (dBm) -
Front-End Loss (dB) - SNDRSENS (dB) $+174 \mathrm{dBm} / \mathrm{Hz}-$
$10 \times$ LOG(bandwidth in Hz)
Low-noise amplifier (LNA) and programmable-gain amplifier (PGA) gain are set according to the Conditions column in the Electrical Characteristics table. The output SNDR is measured using MAX-PHY and the bandwidth of the measurement is defined by the digital filters in MAXPHY. DC at the output is excluded from the SNDR measurement. SNDR is calculated using an FFT of the output bytes with a typical FFT length of $2^{14}$ output samples.

Pin Description (continued)

| PIN | NAME | FUNCTION |
| :---: | :---: | :---: |
| 8 | TXINQ+ | Transmitter Noninverting Quadrature Input. Accepts baseband sigma-delta modulated digital bit streams. Connect directly to the baseband processor. |
| 9 | TXINQ- | Transmitter Inverting Quadrature Input. Accepts baseband sigma-delta modulated digital bit streams. Connect directly to the baseband processor. |
| 10 | $\mathrm{V}_{\text {CC_T }}$ TXBB | Baseband Tx Path Supply. Connect to a regulated supply voltage. Bypass each supply to the PCB ground plane with a capacitor placed as close as possible to the pin. Do not share ground vias among multiple bypass capacitors. |
| 11 | CPOUT_TX | Charge-Pump Output for Tx Synthesizer. Also used as the tuning voltage for Tx VCO. Connect to an external loop filter. |
| 12 | VCC_TXPLL | Tx Synthesizer Supply. Connect to a regulated supply voltage. Bypass each supply pin to the PCB ground plane with a capacitor placed as close as possible to the pin. Do not share ground vias among multiple bypass capacitors. |
| 13 | REFOUT | Reference Clock Buffer Output. Configurable by the REFEN pin and SPI. See the REFOUT Functionality section for details. |
| 14 | V CC_REF | Reference Buffer Supply. Connect to a regulated supply voltage. Bypass each supply pin to the PCB ground plane with a capacitor placed as close as possible to the pin. Do not share ground vias among multiple bypass capacitors. |
| 15 | REFIN | Reference Input Pin. Connected to TCXO. Requires a DC-blocking capacitor (1nF). |
| 16 | BYPASS_TX | Tx VCO Bias Bypass. Bypass to ground with a 470nF capacitor as close as possible.to the pin. |
| 17 | GND_TXVCO | Tx VCO Ground. Connect to the PCB ground plane with a separate via. |
| 18 | VCC_TXVCO | Tx VCO Supply. Connect to a regulated supply voltage. Bypass each supply pin to the PCB ground plane with a capacitor placed as close as possible to the pin. Do not share ground vias among multiple bypass capacitors. |
| 19 | AFC_OUT | AFC DAC Output. The DAC is controlled by the register TXLO_AFCDAC (Table 43). |
| 20 | RXOUTI+ | Receiver Noninverting In-Phase Output. Digital sigma-delta modulated LVDS output. Connect directly to the baseband processor. |
| 21 | RXOUTI- | Receiver Inverting In-Phase Output. Digital sigma-delta modulated LVDS output. Connect directly to the baseband processor. |
| 22 | RXOUTQ+ | Receiver Noninverting Quadrature Output. Digital sigma-delta modulated LVDS output. Connect directly to the baseband processor. |
| 23 | RXOUTQ- | Receiver Inverting Quadrature Output. Digital sigma-delta modulated LVDS output. Connect directly to the baseband processor. |
| 24 | $V_{\text {CC_RXBB }}$ | Baseband Rx Path Supply. Regulated Power-Supply Input. Connect to a regulated supply voltage. Bypass each supply pin to the PCB ground plane with a capacitor placed as close as possible to the pin. Do not share ground vias among multiple bypass capacitors. |
| 25 | N.C. | No Connection. Leave unconnected. |
| 26 | VCC_CLKVCO | Clock Generation VCO Supply. Connect to a regulated supply voltage. Bypass each supply pin to the PCB ground plane with a capacitor placed as close as possible to the pin. Do not share ground vias among multiple bypass capacitors. |

# Band I, V, and VIII WCDMA Femtocell Transceiver with GSM Monitoring 

Pin Description (continued)

| PIN | NAME | FUNCTION |
| :---: | :---: | :---: |
| 27 | GND_CLKVCO | Clock Generation Synthesizer Ground. Connect clock generation synthesizer ground to the PCB ground plane with a separate via. |
| 28 | VCC_CLKPLL | Clock Generation Synthesizer Supply. Connect to a regulated supply voltage. Bypass each supply pin to the PCB ground plane with a capacitor placed as close as possible to the pin. Do not share ground vias among multiple bypass capacitors. |
| 29 | SCLK | SPI Interface Clock Input. Data is clocked in to the serial data input on the rising edge of SCLK. See Figure 4 for details. |
| 30 | $\mathrm{V}_{\text {CC_RXPLL }}$ | Rx Synthesizer Supply. Connect to a regulated supply voltage. Bypass each supply pin to the PCB ground plane with a capacitor placed as close as possible to the pin. Do not share ground vias among multiple bypass capacitors. |
| 31 | CPOUT_RX | Rx Synthesizer Charge-Pump Output. Also used as the tuning voltage for Rx VCO. Connect to an external loop filter. |
| 32 | BYPASS_RX | Rx VCO Bias Bypass. Bypass to ground with a 470nF capacitor as close as possible to the pin. |
| 33 | GND_RXVCO | Rx VCO Ground. Connect ground to the PCB ground plane with a separate via. |
| 34 | VCC_RXVCO | Rx VCO Supply. Connect to a regulated supply voltage. Bypass each supply pin to the PCB ground plane with a capacitor placed as close as possible to the pin. Do not share ground vias among multiple bypass capacitors. |
| 35 | DOUT | SPI Data Output |
| 36 | VCC_MXR | Rx Mixer Supply. Connect to a regulated supply voltage. Bypass each supply pin to the PCB ground plane with a capacitor placed as close as possible to the pin. Do not share ground vias among multiple bypass capacitors. |
| 37 | MIXINH | High-Band Rx Mixer Input. RF input to mixer from an external filter (optional). Internally DC-blocked and matched to $50 \Omega$. |
| 38 | MININL | Low-Band Rx Mixer Input. RF input to mixer from an external filter (optional). Internally DC-blocked and matched to $50 \Omega$. |
| 39 | GPO3 | General-Purpose Output. Controlled by register 7 (Table 20). GPO3 can also be configure as a PLL lock-detect output. |
| 40 | VCC_LNA | LNA Supply. Connect to a regulated supply voltage. Bypass each supply pin to the PCB ground plane with a capacitor placed as close as possible to the pin. Do not share ground vias among multiple bypass capacitors. |
| 41 | LNAOUTL | Low-Band LNA Output. RF output from LNA 3 to external SAW filter. Internally DC-blocked and matched to 50 . |
| 42 | LNAOUTH | High-Band LNA Output. RF Output from LNA 1 to an external SAW filter. Internally DC-blocked and matched to $50 \Omega$. |
| 43 | REFEN | Configuration for REFOUT. When REFEN $=0$, REFOUT can be configured for CMOS or low-voltage output by the SPI interface. See the REFOUT Functionality section. When REFEN $=1$, REFOUT is configured as REFIN buffer with CMOS output. |
| 44 | RXIN2 | Low-Noise Amplifier Input 2. Requires AC-coupling and external matching. |
| 45 | GND_LNAP | PCS LNA Ground. Connect directly to ground plane. |
| 46 | RXIN1 | Low-Noise Amplifier Input 1. Requires AC-coupling and external matching. |
| 47 | GPO2 | General-Purpose Output. Controlled by register 7<3:2>. |

| - | EP | Exposed Pad. Connect to a large ground plane to maximize thermal performance. |

## Detailed Description

## Quad RF Inputs

The MAX2550 features five independent RF inputs. RXIN1 and RXIN3 are used for receiving WCDMA Bands $\mathrm{I}, \mathrm{V}, \mathrm{VI}$, and VIII. Bands I, V, VI, and VIII WCDMA/PCS downlink can be monitored (network listen) by programming the part to receive through the RXIN4 and RXIN5 inputs. RXIN2 can be used to monitor Band III. This allows the base station to monitor surrounding cells to select the best operating conditions (transmit power, codes, frequency, capacity, etc.)

## REFOUT Functionality

The MAX2550 features a reference oscillator buffered output that is configurable by the REFEN input and Register 29. REFOUT can be configured as CMOS or as a low-voltage output. Table 2 lists all REFOUT configurations.

## Receiver System Gain Control

The device features programmable-gain LNAs and programmable variable-gain baseband amplifiers, allowing the system gain to be entirely controlled by the serial interface. RX1, RX2, RX3, and RX5 have three possible gain states: high gain, medium gain, and low gain. RX4
has high and low gain modes. The gain state of the LNA in operation is programmed by the LNAGAIN bits in the RX_GAIN[15:14] register. Each LNA requires an external matching network to optimize system sensitivity. Table 3 provides S11 for each LNA input over the specified band of operation, Table 4 provides S11 of RXIN1 and RXIN3 LNA output, and Table 5 provides S11 of the mixer input. The receiver also features a separate dedicated receive path for the 1930 MHz to 1995 MHz band that enables monitoring.
The baseband amplifiers has 16 possible gain states with each LSB providing a gain step of 3dB. The gain state of the baseband amplifiers is programmed by the PGAGAIN bits in the RX_GAIN[11:8] register. The dynamic range of the data converters when using the recommended sampling rates is sufficient to allow for minimal switching of system gain over varying input signal power. Tables 6 and 7 provide suggested LNA and PGA settings for various input signal power ranges. Two possible LNA/PGA gain settings are provided for the uplink band. Case 1 (Table 6) allows for 3GPP TS25.104 compliance under all conditions while case 2 (Table 7) allows best sensitivity, but compromises adjacent channel selectivity and intermodulation in high-gain LNA mode.

# Band I, V, and VIII WCDMA Femtocell Transceiver with GSM Monitoring 

## Digital I/Q Receive Interface

The baseband output of the device is in the form of a digital I/Q interface. The received signals are sampled by a 1 -bit sigma-delta modulator clocked at 153.6 MHz for WCDMA and 26 MHz for GSMK. The digital bitstream out of the converter is transported from the device to the baseband processor by a low-voltage differential signaling (LVDS) interface. The output data is single-bit nonreturn-to-zero (NRZ). The device does not perform any encoding of the data and no clock is exchanged between the device and the baseband processor.
The device performs limited analog filtering only to minimize aliasing; all channel filtering is realized entirely in the digital domain. The digital filtering removes undesired signals as well as the inherent quantization noise of the sigma-delta modulator. In addition, the device's analog filters include a pole at approximately half the channel bandwdith that must be equalized by the digital filters.
The differential outputs require a termination resistor at the digital baseband IC inputs. The output current of the LVDS drivers are programmable by the LVDSI_2X bit in the BB_CLKOUT register to accommodate different termination resistors. Set LVDSI_2X = 1 to set the drive current to nominal for operation with $120 \Omega$ differential loads.

## Digital I/Q Transmit Interface

The Tx baseband input of the device is in the form of a sigma-delta modulated digital I/Q interface. The digital bitstream of the baseband processor is transported to the device by a low-voltage differential signaling (LVDS) or DDR3 interface. The LVDS signal has a typical common-mode voltage of 1.2 V and a differential swing of 140 mV P-p, while DDR3 has a common-mode voltage of 0.75 V and differential of 600 mV P-p. For LVDS, the input data should be in single-bit NRZ format; no clock is exchanged between the baseband processor and the device. The device recovers the I/Q bitstreams with an on-chip data recovery circuit. The bitstream is converted to an analog signal and filtered prior to upconversion to an RF signal.

Baseband Input Level
The baseband input is in digital 1-bit sigma-delta converted format. There are internal 1-bit I/Q DACs that restore the level of the incoming digital signals to a repeatable analog level in the device. At a given TX_GAIN value, the RMS output power level depends on the density of the bit stream, not the voltage level of the LVDS digital signal. The density of the bit stream, in turn, depends on the input level of the sigma-delta converter, which resides in the baseband chip. The condition for the AC performance in the EC table calls for -4 dBFs peak, which means -4 dB relative to the full scale of the input of the sigma-delta converter. The sigma-delta converter, coded in Verilog, and implemented on FPGA has 10 bits ( 9 bits + sign) at the input. In this case, the full scale is $\pm 511$, and -4 dBFs peak means $\pm 322$ peak excursion. The RMS level is lower than this number, depending on the peakaverage ratio of the signal. For TM1, the peak-average is 10.6 dB at $0.01 \%$, so the RMS level of the baseband signal is -14.6 dBFs , or $\pm 95$.

DC Offset
While the inherent DC offset at the I/Q outputs is very low, it is expected that the baseband processor digitally removes any DC offset.

Digital Filters/Sigma Delta Modulator
Verilog code is available for implementation of the sigmadelta modulator and digital filters in the baseband processor. Contact the factory for more information.

Fractional-N Synthesizers
The device includes three fractional- N frequency synthesizers. One synthesizer is used to generate the receive RF local oscillator (LO), the second is used to generate the transmit RF local oscillator, while the third is used to generate the ADC sampling clock. The loop filter for the ADC sampling clock synthesizer is integrated on-chip. RF synthesizers require an external loop filter. All synthesizers have 20 bits of fractional resolution.

Figure 1. Digital Baseband Receiver Interface

Figure 2. Baseband Input Example

# Band I, V, and VIII WCDMA Femtocell Transceiver with GSM Monitoring 

## RF Synthesizers

For the receiver the RF LO frequency is programmed by the RXLO_FRAC [19:0] (Fractional) register and the RXLO_SYN[7:0] (Integer) register. The synthesizer frequency is demonstrated by the following example.
Assume:

$$
\begin{gathered}
f_{\text {REFIN }}=f_{C O M P A R I S O N}=19.2 \mathrm{MHz} \\
f_{\text {LO }}=f_{\text {REFIN }} \times\left(\text { RXLO_SYN }+\frac{\text { RXLO_FRAC }}{2^{20}}\right) \times K
\end{gathered}
$$

where:
$K=1$ if RXIN1, RXIN2, RXIN5
$K=0.5$ if RXIN3, RXIN4
For the transmitter the RF LO frequency is programmed by the TXLO_FRAC [19:0] (Fractional) register and the TXLO_SYN[7:0] (Integer) register. The synthesizer frequency is demonstrated by the following example.
Assume:

$$
\begin{gathered}
f_{\text {REFIN }}=f_{\text {COMPARISON }}=19.2 \mathrm{MHz} \\
f_{\text {LO }}=f_{\text {REFIN }} \times\left(T X L O \_S Y N+\frac{T X L O \_F R A C}{2^{20}}\right) \times \mathrm{K}
\end{gathered}
$$

where:
$K=0.5$ for TXOUTL
$K=1$ for TXOUTH
Calculate the required divider ratio by dividing the LO frequency by the reference frequency.

$$
\text { Divider }=\frac{f_{\text {LO }} \times 2}{f_{\text {COMPARISON }}}=\frac{1910 \mathrm{MHz}}{19.2 \mathrm{MHz}}=99.479166
$$

The integer-N divider is equal to the integer portion of the divider ratio, 99 in this example. Convert the integer-N decimal value to binary and program into the RXLO_SYN bits.

$$
\begin{aligned}
\text { Integer-N divider }=99 & =0 \times 63=01100011 \rightarrow \\
\text { RXLO_SYN } & =01100011
\end{aligned}
$$

The fractional- N divider is equal to the fractional portion of the divider ration, 0.479166 in this example. Convert the fractional portion of the divider to a 20-bit word by
multiplying by 220 and rounding to the nearest whole number. Then, convert the result to binary and program the bits into the RXLO_FRAC.

Fractional-N divider $=0.479166 \times 2^{20}=502442=$ $0 \times 7 A A A A \rightarrow$ RXLO_FRAC $=0 \times 7 A A A A$

## ADC Clock Synthesizer

The sampling clock frequency is controlled by the CINT (BBCLK_SYN[7:0]) and CFRAC (BBCLK_FRAC[19:0]) registers. The sampling clock synthesizer does not need to be repeatedly programmed during normal operation. The sampling clock frequency (f ADCCLK ) is 153.6 MHz in WCDMA mode and 26 MHz in GSM mode. The dynamic range of the converters with this sampling frequency is sufficient to meet all system specifications with very minimal control of the PGA.
Assume:

$$
f_{\text {REFIN }}=\mathrm{f}_{\mathrm{COMPARISON}}=19.2 \mathrm{MHz}
$$

## ADC Clock Synthesizer Fractional Frequency Correction

The ADC clock synthesizer uses a 20-bit frequency synthesizer and can be enhanced by a fractional error correction. Parameters PBYQ_RATUP and PBYQ_RATDN implement the following function.

$$
\begin{gathered}
\mathrm{f}_{\text {ADCCLK }}=\mathrm{f}_{\text {REFIN }} \times\left(\mathrm{CINT}+\left(\mathrm{CFRAC}+\mathrm{PBYQ} \mathrm{\_RATUP/}\right.\right. \\
\left.(\text { PBYQ_RATUP }+ \text { PBYQ_RATDN })) / 2^{20}\right) \times \mathrm{K} \\
\text { PBYQ_RATUP/(PBYQ_RATUP + PBYQ_RATDN })= \\
\left(\mathrm{f}_{\text {ADCCLK }} / \mathrm{f} \text { REFIN }-\mathrm{CINT}\right) \times 2^{20} \times \mathrm{K}-\mathrm{CFRAC}
\end{gathered}
$$

where:
$\mathrm{K}=8$ if WCDMA
$K=48$ if GSM/PCS/DCS
PBYQ_RATUP and PBYQ_RATDN should be chosen for the best fit.
This feature can be enabled or disabled through EN_ PBYQDIV (REG15<22>). Table 8 shows the PBYQ_ RATUP and PBYQ_RATDN with commonly used crystal oscillator frequencies.

Power-Down Modes
The device features multiple power-down modes that can be controlled by hardware or software. Table 9 describes the various power-down modes.

# Band I, V, and VIII WCDMA Femtocell Transceiver with GSM Monitoring 

## Carrier and Sideband Suppression Optimization

The device delivers a typical carrier suppression of -40 dBc and a sideband suppression of -45 dBc without any external calibration; however, if greater suppression is required, the device is capable of overriding the factory settings and accepting manual calibration from the baseband processor.

## RF Band Configuration

The device has configurable VCO and LO generation to support Bands I, V, and VIII forward and reverse link operation. In transmit signal path, LC tank is also configurable to optimize performance in both bands. Table 10 shows the key difference in SPI settings.

General-Purpose Outputs
The device is equipped with three general-purpose outputs. GPO3 can also be configured as a PLL lock detect for the Rx, Tx, or Rx and Tx. See Table 20 for how to properly configure the general-purpose outputs.

## Band I, V, and VIII WCDMA Femtocell Transceiver with GSM Monitoring

## Power-On Reset (POR)

Recommended defaults are not guaranteed upon powerup and are provided for reference only. All registers must be written with the proper values no earlier than 100 s after power-up. Figure 3 displays the time it takes for Tx/Rx PLL lock detect (GPO3) to become active after power-up and enabling the correct registers for proper operation. All reserved registers should only be written with default values.

Temperature Sensor
An on-chip temperature sensor is enabled by programming RX_ENABLE<14> = 1 . To trigger temperature sensor ADC reading, program RX _MISC2<6> from 0 to 1 . The ADC acquires the 5 -bit logic output in $2 \mu \mathrm{~s}$; the temperature sensor needs to be on (RX_ENABLE<14> = 1) to maintain the ADC logic output. To read the 5-bit logic output through the DOUT pin, apply 4 -wire SPI readout programming sequence to RX_MISC2<11:7>.

## 4-Wire Serial Interface

The device includes 32 programmable 26 -bit registers. The most significant bit (MSB) is the read/write selection bit (R/W in Figure 4). The next 5 bits are register address (A[4:0] in Figure 4). The 26 least significant bits (LSBs) are register data ( $\mathrm{D}[25: 0]$ in Figure 4). Register data is loaded through the 4 -wire SPI/MICROWIRETM-compatible serial interface. MSB of data at the DIN pin is shifted in first and is framed by $\overline{\mathrm{CS}}$. When $\overline{\mathrm{CS}}$ is low, input data is shifted at the rising edge of the clock at the SCLK pin. At $\overline{\mathrm{CS}}$ rising edge, the 26 -bit data bits are latched into the register selected by the address bits. See Figure 4. There is no power-on SPI register self-reset functionality in the device; the user must program all register values after power-up. During the read mode, register data selected by address bits is shifted out to the DOUT pin at the falling edges of the clock.

## Register and Bit Descriptions (If Applicable)

The operating mode of the device is completely controlled by 32 on-chip registers.

Recommended defaults are not guaranteed upon powerup and are provided for reference only. All registers must be written with the proper values no earlier than 10 $\mu \mathrm{s}$ after power-up (once $\mathrm{V}_{\mathrm{CC}_{-}}$is $90 \%$ of final value). All reserved registers should only be written with default values.

## Band I, V, and VIII WCDMA Femtocell Transceiver with GSM Monitoring

## Applications Information

## Layout Considerations

The EV kit and reference design serve as a guide for PCB layout. Keep RF signal lines as short as possible to minimize losses and radiation. Use controlled impedance
on all high-frequency traces. The exposed pad must be soldered evenly to the board's ground plane for proper operation. Use abundant ground vias between RF traces to minimize undesired coupling. Bypass each $V_{C C}$ _ pin to ground with capacitors placed as close as possible to the pin.

Simplified Block Diagram

## Ordering Information

| PART | BAND | TEMP <br> RANGE | PIN- <br> PACKAGE |
| :---: | :---: | :---: | :---: |
| MAX2550ETN+ | I, V, and <br> VIII | $-40^{\circ} \mathrm{C}$ to <br> $+85^{\circ} \mathrm{C}$ | 56 TQFN-EP* |

+Denotes a lead(Pb)-free/RoHS-compliant package. ${ }^{*} E P=$ Exposed pad.

## Package Information

For the latest package outline information and land patterns (footprints), go to www.maxim-ic.com/packages. Note that a " + ", "\#", or " - " in the package code indicates RoHS status only. Package drawings may show a different suffix character, but the drawing pertains to the package regardless of RoHS status.

| PACKAGE <br> TYPE | PACKAGE <br> CODE | OUTLINE <br> NO. | LAND <br> PATTERN NO. |
